

CLUSTERING OF AGES
FOUND IN REPORTED CASES OF
A NEAR-DEATH EXPERIENCE

Age Clusters	Correlations
--------------	--------------

CHILDREN AND YOUNG ADULTS:

- | | |
|----------------------|---|
| * Birth to 15 months | When the actual wiring of the brain is determined and synapse formation increases 20-fold; utilizes twice the energy of an adult brain. |
| * 3 to 5 years | Time of temporal lobe development; explore and experiment with possible roles, future patterns, and continuity of environment. |
| 10 to 14 years | Time of puberty; hormone fluctuations, sexuality questioned, identity crisis. |

MATURE ADULTS:

- | | |
|------------------|--|
| * 27 to 32 years | Cross-over time between adherence to values of friends, family, and the pressures of the workplace – and the urge to establish self as an independent and mature ego; social crisis. |
|------------------|--|

Note: Other clusters not as tight with mature adults, but did notice slight clusterings around the ages of 39, 49, and 59. Kids data based on 1997 analysis; adults, on 1994 analysis. Asterisks with children show where the largest clusters were with the near-death research I conducted; same is true with adults. Strongest evidence for genius with experiencers was from birth to 15 months. Most alien, fairy, and monster sightings *with typical children* usually occur between 3 to 5 years of age (same timeframe for most NDE reports from kids).

This chart appears in several books, among them *Children of the New Millennium* (Three Rivers Press, NYC 1999); and *The New Children and Near-Death Experiences* (Inner Traditions, Rochester, VT 2003).
